$$\underline{LC_j} \leftarrow (m, t_k = LC_k)$$

$$\rightarrow \max(L_j, L_k) + 1$$

$$\rightarrow \boxed{LC_1} \rightarrow \boxed{22} < \boxed{22}$$

$$\rightarrow 22 + 1 = \underline{23}$$

$$\boxed{23} < 22$$

$$\underline{\max(23, 22) + 1 = 24} \checkmark$$

Potential problem

* ~~Neither~~ $\boxed{P_2}$ not P_3 will know the status of P_1

Logical Counter.

Neither L_2, L_3 before the receipt of m_2 .

$\checkmark \boxed{P_2}$ can see the time (logical) stamp of P_3 .

Vector clocks

$$n=3 \quad VC_i[3] = \left(\frac{L_i}{1}, \frac{L_j}{2}, \frac{L_k}{3} \right)$$

$$\frac{VC_i[i]++}{@P_i}$$

Rules:

* $VC(a) \rightarrow$ an event a

* if $VC(a) \leq VC(b)$ for events a & b .

\Rightarrow event a causally precedes event b .

$a \rightarrow b$ if $\underline{c(a)} < \underline{c(b)}$.

$$\underline{VC(a)} < \underline{VC(b)}$$

* Each P_i maintains $\underline{VC_i}$

Properties:

$\rightarrow \underline{VC_i[i]} = \# \text{ events } @ P_i$

$\rightarrow VC_i[i] \rightarrow$ local logical clock @ P_i

$\rightarrow \underline{VC_i[j]} = \underline{k}$
@ P_i

$\Rightarrow P_i$ knows that k events happened @ P_j

$\Rightarrow P_i$ has knowledge of local time @ P_j

$$-1 \quad (0,0,0) \xrightarrow{m_{12}} \begin{pmatrix} 1 & 2 \\ 0 & 1 \\ 0 & 0 \end{pmatrix} \rightarrow (2,1,0)$$
